

BACSTEL-IP

What is BACSTEL-IP?

BACSTEL-IP

BACSTEL-IP is the platform for the future of automated payments

BACSTEL-IP is more than an upgrade of the existing BACSTEL service, it is a totally new delivery channel that gives you more control, easier management of your processing - and a far faster service all round.

The new delivery channel, which provides BACS customers with a secure and direct online telecommunications access to the BACS Service, is called BACSTEL-IP.

Based on Internet protocols and using the latest Public Key Infrastructure (PKI) technologies for the highest level of security, BACSTEL-IP offers a reliable and cost-effective way of accessing the BACS payment services.

BACSTEL-IP provides the following:

- A secure method for delivery of Direct Debits, Direct Credits and AUDDIS items to the BACS service
- A secure channel that enables access to BACS input reports, returned payment advices and payment message advices
- Greater efficiency using proven technologies, including TCP/IP, and fully utilising PKI and the latest cryptographic methods
- A guarantee of the quality, integrity and confidentiality of your data
- Enhanced reliability and quality service through BACS approved software, which meets the rigorous standards set by BACS Payment Schemes and its members
- Time saving through the elimination of paper reports, which will reduce costs, increase accuracy and reliability and enable back office automation, relieving key staff from onerous chores so that they can be deployed on more important tasks and reducing the risk of error and fraud.
