

Q&A 10 Datasheet

Infor Query & Analysis 10: Improvements over Vision 6.3.4

Duplicate User Profile Options

In Query & Analysis Setup, it is possible to copy Options settings, such as Access Tables, from one Query & Analysis User Profile to another.

Modifying User Profiles

In Query & Analysis Setup, it is possible to simultaneously make setting changes to multiple Query & Analysis User Profiles. Currently it is necessary to modify each User Profile individually. Administrators are also able to delete multiple User Profiles at the same time.

Define Criteria

Vision Executive's Define Criteria has been enhanced to enable Query & Analysis users to delete a Data Filter Item referenced in multiple query definitions.

In previous releases it is only possible amend Data Filter Item values, not remove the Data Item itself.

The inclusion of the feature makes it easier to globally change a report comprised of query definitions with a Data Filter Item, such as an analysis code, which is no longer required.

Cross Sheet Referencing

Vision Executive supports cross sheet cell referencing. The Query & Analysis 6 Conversion Tool has been enhanced so that Query & Analysis 5 Executive workbooks that contain cross sheet referencing are carried forward once upgraded to Query & Analysis 6.

Cross sheet referencing is used to reference formulas contained in cells between Executive sheets. A cross reference cannot be used to set a query definition filter criteria value, in this case a Reference Prompt should be used instead.

Format Table

The Format Table feature in Executive is able to output numerical values in addition to text. The numerical output could be used for outputting extracted results and rounding.

Ranges and Field Totals

In Report Designer, it is possible to select a range of column totals in order to create a total for all columns. Previously each column had to be selected individually so that cell reference could be appended to the field total formula.

Supports Office 2007

Highly Robust
